

J-CLAMP CUSTOM

SPECIALIST APPLICATIONS

J-CLAMP CUSTOM

J-SAFE are committed to designing and manufacturing a range of edge protection equipment to reduce the risk of falls from height of person and materials.

Experience has shown that in certain circumstances, standard components don't address the needs of the constructor either because of the complexity of the structure or equally because of restricted access or working space available to the operatives.

The capability of J-SAFE Ltd to engineer solutions by combining standard components with modified parts is proven to provide safe and user-friendly methods of protecting the workforce.

All components are manufactured to the highest quality standards, are independently tested and conform to EN 13374. Full documentation and certification is provided with our equipment .

Pictured Above and left. On this project our client required a clamping system to fulfil a dual role.

The existing parapet was to be removed and ultimately replaced with pre-cast sections. J-Safe Ltd. modified a standard clamp by reducing the clamp leg to the depth of the pre-cast unit and adding a plate to increase the bearing capacity.

The modified clamping arrangement fulfilled our clients needs both in practice and cost efficiency by reducing the amount of equipment required on site.

COMPLIANCE TO EN 13374

Our products are designed, manufactured and tested to BS EN 13374:2004 using the latest CAD-CAM manufacturing technology, thereby ensuring both high quality and cost effectiveness. **Please contact us if you have any questions.**
